

Module 1 - Front-End Web Development

JavaScript - Variables and String Manipulation

Overview

In this exercise, you'll learn the fundamentals of JavaScript variables and string handling. You'll practice declaring variables using both 'const' and 'let', combine strings through concatenation, and understand how to output information to the console. This exercise will build your foundation in storing and manipulating basic data in JavaScript.

Requirements:

```
// TODO: Create a variable called firstName and store your first name in it
// TODO: Create a variable called lastName and store your last name in it
// TODO: Create a variable called age using let (you'll modify this later)
// TODO: Create a fullName variable that combines firstName and lastName
// TODO: Print a greeting to the console using these variables
// TODO: Try changing the age variable to a different value
```

Submission:

Save your code in a file named **basics.js** and upload it to the LMS. Demonstrate your code and the console output to your instructor.
