

## Module 1 - Front-End Web Development

### JavaScript – Function Basics

---

#### Overview

In this exercise, **you will work in a pair of 2 as assigned by your lecturer.**

You will learn how to create and use functions in JavaScript. You'll practice writing functions that take parameters, return values, and perform specific tasks. This will help you understand how to organize your code into reusable blocks and make your programs more efficient and maintainable.

#### Requirements:

```
// TODO: Create a function called greet that takes a name parameter
```

```
// TODO: Make the greet function return "Hello, [name]!"
```

```
// TODO: Create a function called add that takes two parameters
```

```
// TODO: Make the add function return the sum of both parameters
```

```
// TODO: Call both functions and store their results in variables
```

```
// TODO: Print the results to the console
```

#### Submission:

Save your code in a file named ***functions.js*** and upload it to the LMS. Demonstrate your code and the console output to your instructor.
