Module 1 - Front-End Web Development

JavaScript - Number Operations and Type Conversion

Overview

In this exercise, you'll work with JavaScript numbers and understand type conversion. You'll learn how to perform basic mathematical operations, convert between numbers and strings, and see how JavaScript handles different data types. This will help you build confidence in handling numerical data and type conversions in your programs.

Requirements:

// TODO: Create a variable called number1 and store any number in it

// TODO: Create a variable called number2 and store a different number in it

// TODO: Convert number1 to a string and store it in a new variable

// TODO: Add number1 and number2 and store the result in a variable called sum

// TODO: Multiply number1 and number2 and store the result in a variable called product

// TODO: Print all results to the console

Submission:

Save your code in a file named *operations-types.js* and upload it to the LMS. Demonstrate your code and the console output to your instructor.
